

Chem 115 POGIL Worksheet - Week 3
Compounds, Naming, Reaction Equations, and Formula Weights
Answers to Key Questions and Exercises

Key Questions & Exercises

- Do all compounds contain molecules?
 No. Only molecular compounds contain molecules of the compound. (Ionic compounds may contain molecular ions, but they are not composed of molecules corresponding to their empirical formulas.)
- What is the difference between a molecular and empirical formula?
 A molecular formula represents the composition of molecules in a molecular compound. An empirical formula is the lowest whole-number ratio of elements in the compound.
- What kinds of compounds (molecular, ionic, network) can be represented with a molecular formula?
 Only molecular compounds
- What kinds of compounds (molecular, ionic, network) can be represented with an empirical formula?
 All three types. With ionic compounds and network solids, and empirical formula is the only appropriate type of chemical formula.
- Using the periodic table, predict the chemical formula of the ionic compound formed by the following pairs of elements:

- Complete the following table by filling in the formula for the ionic compound formed by each pair of cations and anions, as shown for the first pair.

Ion	K ⁺	NH ₄ ⁺	Mg ²⁺	Fe ³⁺
S ²⁻	K ₂ S	(NH ₄) ₂ S	MgS	Fe ₂ S ₃
NO ₃ ⁻	KNO ₃	NH ₄ NO ₃	Mg(NO ₃) ₂	Fe(NO ₃) ₂
SO ₄ ²⁻	K ₂ SO ₄	(NH ₄) ₂ SO ₄	MgSO ₄	Fe ₂ (SO ₄) ₃
PO ₄ ³⁻	K ₃ PO ₄	(NH ₄) ₃ PO ₄	Mg ₃ (PO ₄) ₂	FePO ₄

- Predict whether each the following compounds is molecular or ionic: PF₅ - molecular, NaI - ionic, SCl₂ - molecular, B₂H₆ - molecular, LiNO₃ - ionic, NOCl - molecular, CoCO₃ - ionic, NF₃ - molecular

8. In the chemical formula and name, which element is given first, the metal or nonmetal?
Metals are named first, then nonmetals.
9. What suffix (ending) is added to the root of the name of the nonmetal in naming an ionic compound?
The suffix -ide is added to the root; e.g., sulfur is named sulfide in an ionic compound.
10. When a metal ion can form more than one kind of cation, how is the charge on the cation indicated in the name of a compound?
The charge on the cation, which can be deduced from the known charge on the anion and the number of anions in the empirical formula, is indicated by Roman numerals in parentheses; e.g., CrCl_3 is chromium(III) chloride.
11. Name the following molecular compounds: SCl_2 , N_2O_4 , P_4O_{10} , PF_5
 SCl_2 - sulfur dichloride
 N_2O_4 - dinitrogen tetroxide (The "a" of tetra- is dropped before the "o" of oxide.)
 P_4O_{10} - tetraphosphorous decoxide (The "a" of deca- is dropped before the "o" of oxide.)
 PF_5 - phosphorous pentafluoride
12. Some molecular compounds are not named systematically, but rather retain their traditional names. Name the following compounds that retain their traditional names:
 H_2O , NH_3 , H_2O_2 , H_2S
 H_2O - water (not dihydrogen oxide)
 NH_3 - ammonia (not nitrogen trihydride)
 H_2O_2 - hydrogen peroxide (not dihydrogen dioxide)
 H_2S - hydrogen sulfide (not dihydrogen sulfide, because there is no other hydrogen compound of sulfur)
13. Name the following ionic compounds: AlCl_3 , Li_3PO_4 , $\text{Ba}(\text{ClO}_4)_2$, $\text{Cu}(\text{NO}_3)_2$, $\text{Fe}_2(\text{SO}_4)_3$, $\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2$, $\text{Cr}_2(\text{CO}_3)_3$, K_2CrO_4 , $(\text{NH}_4)_2\text{SO}_4$
 AlCl_3 - aluminum chloride
 Li_3PO_4 - lithium phosphate
 $\text{Ba}(\text{ClO}_4)_2$ - barium perchlorate
 $\text{Cu}(\text{NO}_3)_2$ - copper(II) nitrate
 $\text{Fe}_2(\text{SO}_4)_3$ - iron(III) sulfate
 $\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2$ - calcium acetate
 $\text{Cr}_2(\text{CO}_3)_3$ - chromium(III) carbonate
 K_2CrO_4 - potassium chromate
 $(\text{NH}_4)_2\text{SO}_4$ - ammonium sulfate
14. Give the name or chemical formula, as appropriate, for each of the following acids:
 HClO_4 , HBr , H_3PO_4 , hypochlorous acid, iodic acid, sulfurous acid
 HClO_4 - perchloric acid
 HBr - hydrobromic acid
 H_3PO_4 - phosphoric acid
hypochlorous acid - HOCl (or HClO)

iodic acid - HIO_3
sulfurous acid - H_2SO_3

15. Name the following simple organic compounds: CH_4 - methane, C_2H_6 - ethane, CH_3OH methanol, $\text{C}_2\text{H}_5\text{OH}$ - ethanol

16. Balance the following skeletal equations, using lowest whole-number coefficients:

17. Why is it incorrect to talk about the molecular weight of NaCl ?

There are no molecules of NaCl . We can only talk about the ratio of cations to anions, which defines the empirical formula.

18. Would the sum of the masses of all atoms in the chemical formula $\text{C}_2\text{H}_5\text{OH}$ be a molecular weight or a formula weight?

This is a molecular compound, because it is composed entirely of nonmetals. Also, it is an organic compound, which we recognize as an alcohol. The given formula, then, is a molecular formula, so the sum of atomic weights multiplied by the numbers of each element would give a molecular weight.

19. Is there a difference between the molecular weight and formula weight of the molecular compound N_2O_5 ?

No, because the molecular formula in this case happens to involve a lowest whole-number ratio; viz., 2:5. Thus, the empirical and molecular formulas are identical.

20. Calculate the molecular weight and formula weight of glucose, $\text{C}_6\text{H}_{12}\text{O}_6$.

$$\text{m.w.} = (6)(12.01 \text{ u}) + (12)(1.008 \text{ u}) + (6)(16.00 \text{ u}) = 180.15_6 \text{ u} = 180.16 \text{ u}$$

$$\text{empirical formula} = \text{CH}_2\text{O}$$

$$\text{f.w.} = 12.01 \text{ u} + (2)(1.008 \text{ u}) + 16.00 \text{ u} = 30.03 \text{ u}$$

21. Calculate the percent composition of glucose.

$$\% \text{ C} = \frac{(6)(12.01)}{180.16} \times 100\% = 40.00\%$$

$$\% \text{ H} = \frac{(12)(1.008)}{180.16} \times 100\% = 6.714\%$$

$$\% \text{ O} = \frac{(6)(16.00)}{180.16} \times 100\% = 53.29\%$$
