

CHEM 103

Macroscopic

↪ Particle Level

↪ Symbolic

Lecture Notes
January 24, 2006
Prof. Sevian

1

Thinking like a Chemist

- Macroscopic
 - Matter that comprises everything
 - Properties of materials
- Particle level
 - Structure of matter
 - Energy that governs interactions of particles
- Symbolic
 - Ways of representing behavior of matter

2

Example: Ice (solid water)

Particle Level Understanding

Macroscopic Understanding

Symbolic Representation

Ice crystal structure picture from
http://cwx.prenhall.com/horton/medialib/media_portfolio/text_images/FG02_05.JPG

What Kind of Information?

- Macroscopic: iceberg has properties
 - Appears white
 - Floats on water
- Particle level: ice structure explains
 - Regular, repeating lattice structure
 - What are the “holes”?
- Symbolic: $\text{H}_2\text{O (s)}$ explains
 - Basic formula: two H for every one O
 - Solid phase

Macroscopic Understanding

What are some properties of ice?

From Chemistry & Chemical Reactivity 5th edition by Kotz / Treichel. C 2003. Reprinted with permission of Brooks/Cole, a division of Thomson Learning: www.thomsonrights.com, Fax 800-730-2215.

5

What kinds of properties?

- It melts at 32°F
- It's cold (what does this mean?)
- It cools down a hot drink
- It tastes like water
- It has no odor
- It is used to put out fires
- It soaks into most things (wets them)
- Lots of materials can dissolve in it
- Ice floats in liquid water

6

Macroscopic Understanding

Physical properties

observed and measured
without changing the
composition of a material
(*e.g.*, color, odor, hardness,
density, melting
temperature)

Chemical properties

involve a change in
composition of the
material (*e.g.*,
flammability, reactivity)

7

Properties can be...

Extensive

depend on the amount of
material present (*e.g.*,
mass, volume, weight)

Intensive

independent of the amount
of material present (*e.g.*,
density, chemical
composition)

8

Ice: What can we observe?

- It melts at 32°F
- It's cold (it feels cold to the touch)
- It cools down a hot drink
- It tastes like water
- It has no odor
- It is used to put out fires
- It soaks into most things (wets them)
- Lots of materials can dissolve in it
- Ice floats in liquid water

9

What kinds of properties?

- Ice melts at 32°F → Physical, Intensive
- It's cold (it's cold to the touch)
- It cools down a hot drink
- It tastes like water
- It has no odor
- It is used to put out fires
- It soaks into most things (wets them)
- Lots of materials can dissolve in it
- Ice floats in liquid water

10

What kinds of properties?

- Ice melts at 32°F → Physical, Intensive
- It's cold (it's cold to the touch)
- It cools down a hot drink
- It tastes like water
- It has no odor
- It is used to put out fires
- It soaks into most things (wets them)
- Lots of materials can dissolve in it
- Ice floats in liquid water

12

Why is this important?

- Intensive properties can be used to identify a material, extensive properties cannot
- Intensive properties have predictive power, extensive properties do not
- Physical properties depend on the organization of the particles that comprise the matter
- Chemical properties depend on energy considerations when one kind of matter interacts with another

14

Think-Pair-Share

A sample of ethanol	Intensive or extensive?	Chemical or physical?
Boils at 79 °C		
Fills a volume of 200 mL		
Does not react with water		

15

Particle Level Understanding

How does a particle level understanding explain some properties of ice?

17

Ice Structure

- H-O-H bond angles and attraction between one water's H and another's O give rise to regular, repeating hexagonal pattern → Ice is a solid up to 0°C
- Solid structure is more “expanded” than liquid → Ice floats in liquid water
- Distances between some water molecules are close to the wavelength of visible light waves → Snow appears white

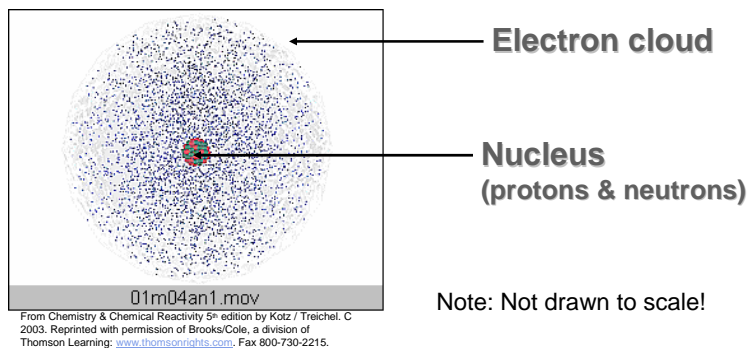

18

Particle Level Understanding

Matter is composed of atoms

What is an atom?

19

How many kinds of atoms?

1A																	7A	8A			
1																	1	2			
H																	He	He			
2A																					
3	4															5	6	7	8	9	10
Li	Be															B	C	N	O	F	Ne
11	12															13	14	15	16	17	18
Na	Mg															Al	Si	P	S	Cl	Ar
19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36

20

Particle Level Understanding

Matter is composed of atoms.

Therefore, it can be broken down into atoms.

Water (H₂O) can be broken into hydrogen (H) and oxygen (O), which are present in exactly a 2:1 ratio.

Caffeine ($\text{C}_8\text{H}_{10}\text{N}_4\text{O}_2$) can be broken into carbon (C), hydrogen (H), nitrogen (N), and oxygen (O), which are present in exactly an 8:10:4:2 ratio.

21

Symbolic Representation

What information does the formula contain?

22

What hidden information does a symbol contain?

Each unit (molecule) of H_2O has:

One O atom (red)

Two H atoms (yellow)

23

Many Symbolic Representations

Macro-Particle-Symbolic

Each level provides information

- Macroscopic
 - Properties of matter
- Particle Level
 - Interactions between particles that give rise to matter's properties
- Symbolic
 - Representation of matter

H₂O (s) Representation

A single molecule
(unit) of water, H₂O

A two-dimensional picture of several
units of water, H₂O, in a liquid state

27

Solid vs. Gaseous N₂

N₂ (s)

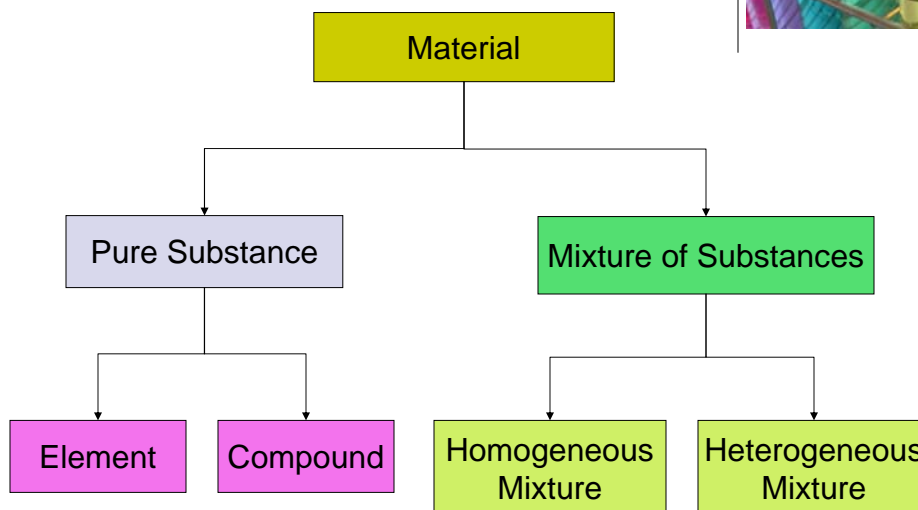

N₂ (g)

Note: Not drawn to scale. True density of a gas is about 1/1000th of solid.
